

LEAD & COPPER SAMPLING INSTRUCTIONS

Select a water faucet inside your house to draw the sample from. The primary choice would be your kitchen sink (this is where most of the water for use for cooking and drinking comes from). If that is not an available option a second choice would be the faucet at your bathroom sink. Be sure to sample from the cold water side!

FIRST THING IN THE MORNING, BEFORE ANY WATER HAS PASSED THROUGH THE FAUCET, fill the container provided to the top with water from the cold tap. **Do NOT rinse out the container first. It is important that you fill the container completely.** Then tightly screw the cap back on. **It is very important to fill the container with the first water drawn from the faucet that day.**

Finally, fill out the label on the container with your address and the date and time the sample was collected.

Thank you for your assistance!
